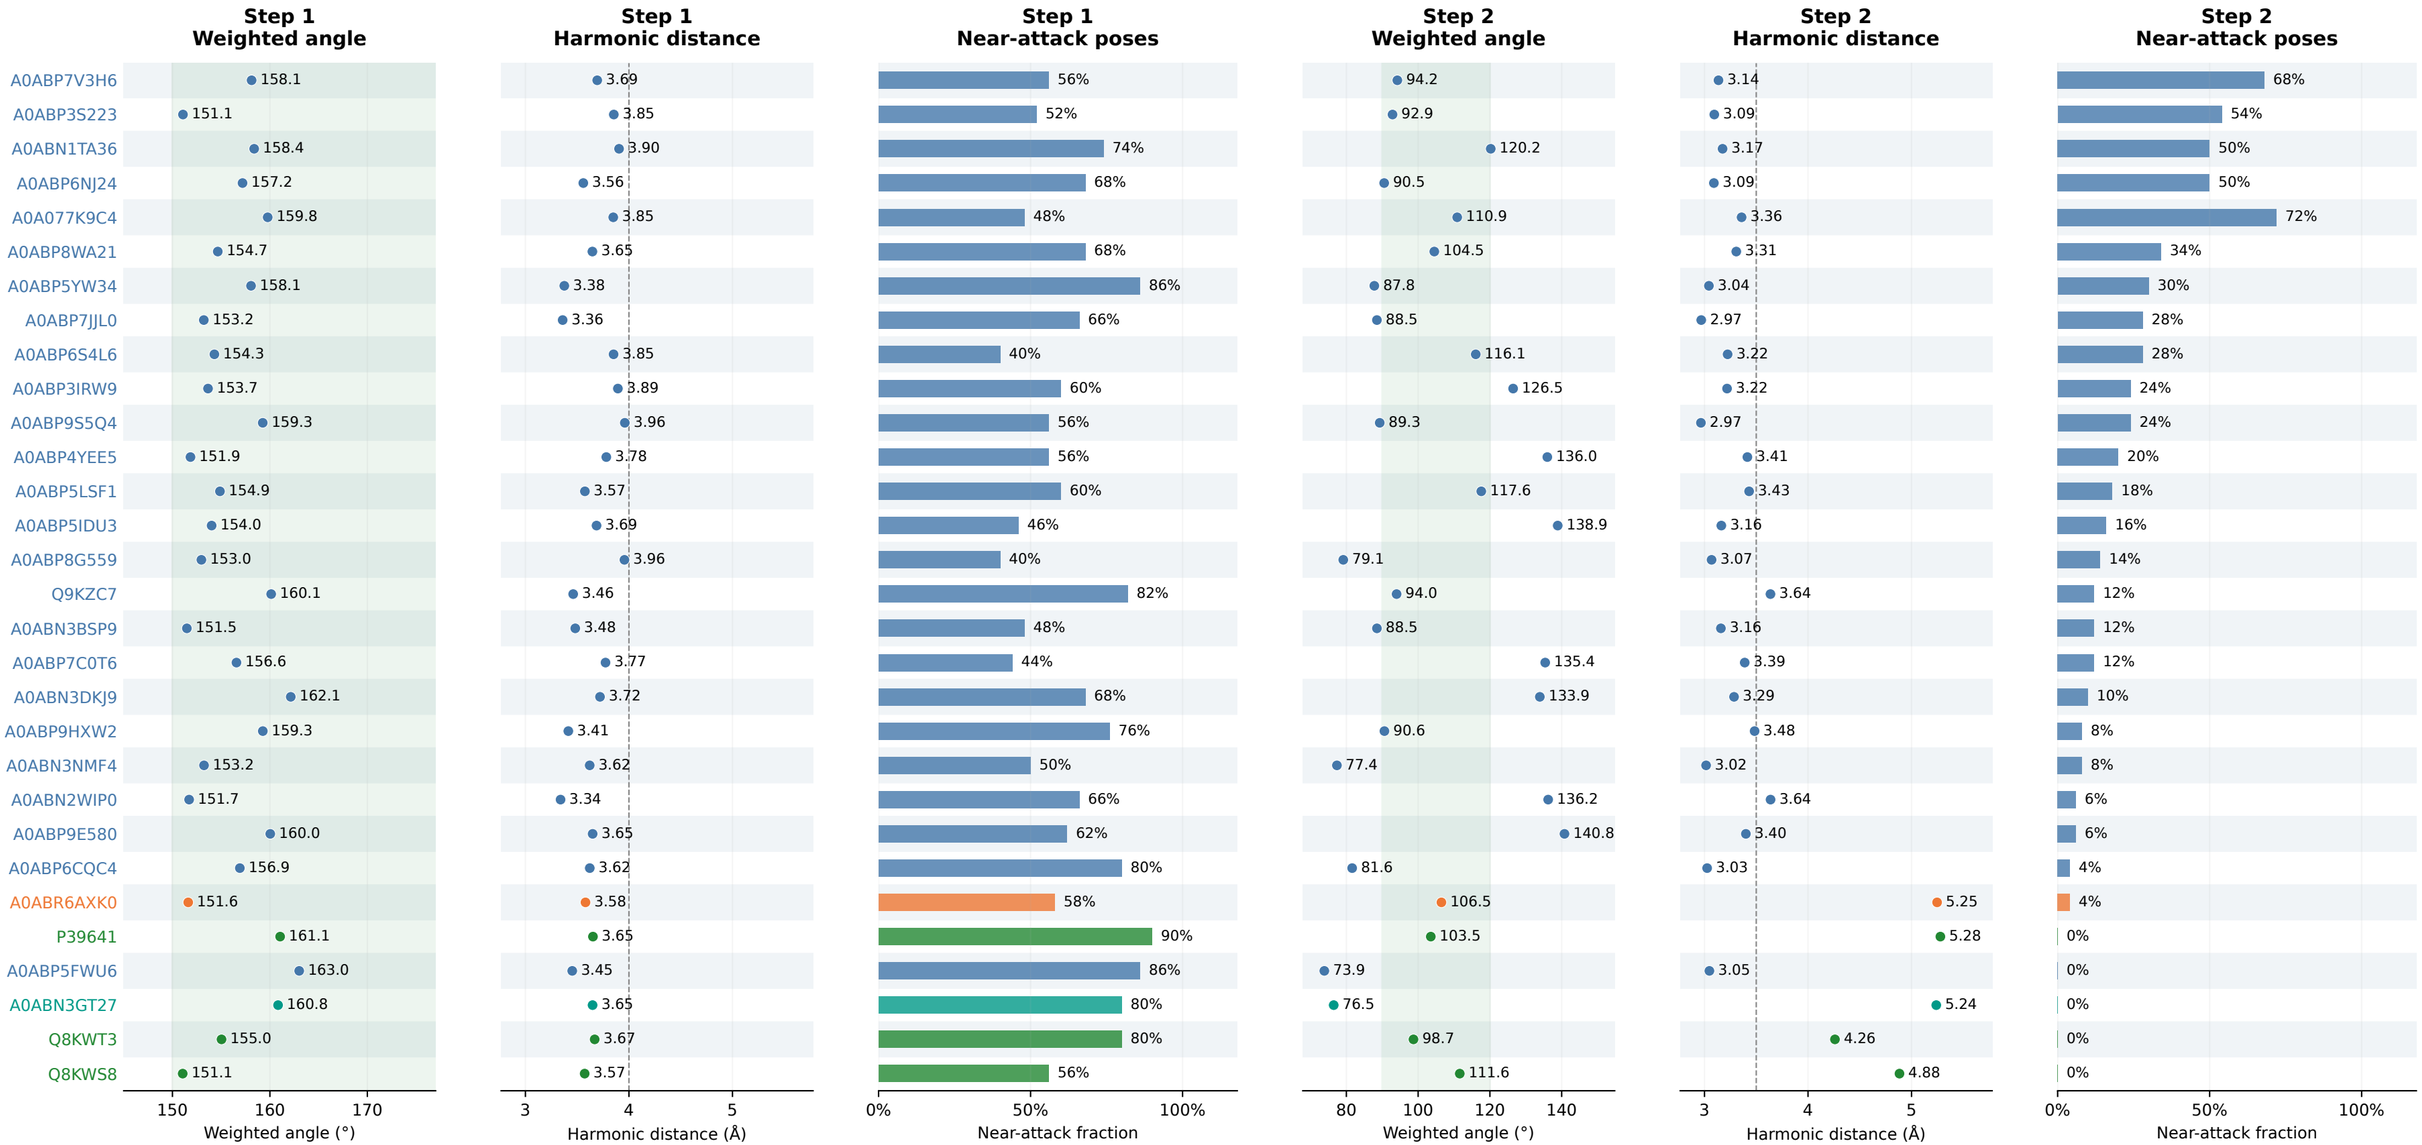
Original step 1 upper-left group: both steps for the same 30 candidates

Same enzyme on each row · ordered by min(step 1 near-attack fraction, step 2 near-attack fraction)



Gamma-glutamylpolyamine synthetase GlnA3 (n=25)
L-amino acid ligase (n=1)
Alanine--anticapsin ligase (n=3)
Staphyloferrin B biosynthesis protein SbnC (n=1)

Step 1 near attack: d <4 Å and θ >150°. Step 2: d <3.5 Å and 90° ≤ θ ≤120°. 50 poses/stage; pocket violations excluded from step 2.
The minimum fraction is a structural prioritization heuristic, not a reaction probability or validated activity score. Step 2 uses forced pocket restraints.
