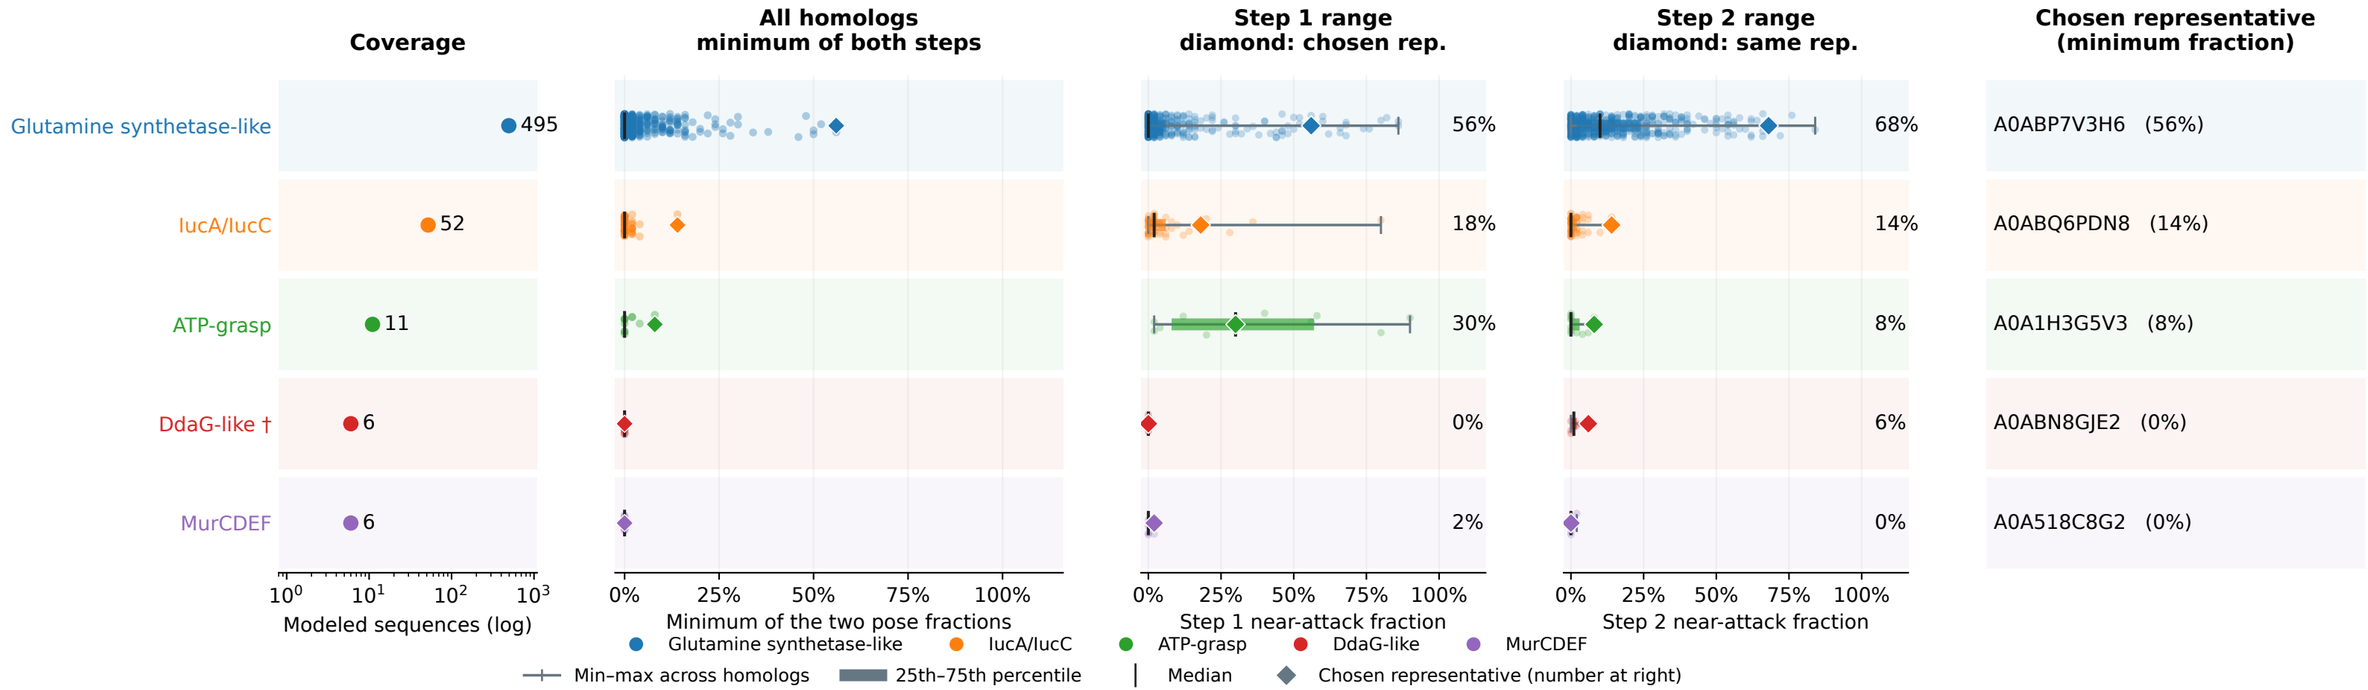
Glutarate + cadaverine: broad protein families and sampling coverage

Ranges span modeled homologs. Both step diamonds mark the same enzyme, selected using the minimum of its two pose fractions.

† User-reported experiment — ddaG: positive activity, low yield; construct match pending



Ranges show variation across homologs, not confidence intervals. Diamonds and their percentages refer to the named two-step-selected representative.
Structural ranking is not a calibrated activity prediction. Family labels are transferred from reference UniProt/Pfam annotations; strict orthology is unverified.
